

Varmebaronen heats another family home

The West Wales installation of a Varmebaronen UB boiler and 200kg silo linked to a Varmebaronen Aqualux Teknik multi energy source cylinder provided the family with a complete and compact installation. The boiler is designed to the latest Class 5 European emissions standard and is linked to the Varmebaronen cylinder which acts as a buffer, integrated domestic hot water cylinder and includes a solar thermal coil which provided the perfect solution for the owner as it allowed them to link their existing solar thermal panels into the new system.

Compact spaces aren't an issue for the Varmebaronen Range

The multi connection points on the cylinder and the internal stratification allowed heat to be taken from the cylinder at different points for the under floor heating and radiators thereby ensuring the most efficient and economical usage of the available heat.

The Pellmax boiler is exceptional value and with payments from the Domestic Renewable Heat Incentive it offers many the opportunity to switch to green alternatives without breaking the bank!

The great thing we're finding as installers of these systems is how quick and simple they are to install. The installation for the biomass system took roughly a week. While on going service and maintenance for the Varmebaronen's are straight forward due to minimal moving parts and all components are accessible from the front!
